The first results of comparative investigations of the
heat transfer in the glass bath with luminous and
roaring flames from unpurified and purified generator
gas in a bath depth of 24 cm show only in the top layer
of 1 cm a temperature drop which is greater by 70%.
Below this layer of 1 cm the temperature course and the
mean effective heat conductivity are independent of the

A thermal differential analysis showed that normal
paraffin waxes with a lower molecular weight can give
rise to two transition phenomena, while those of higher
molecular weight show only one, and that the value of
the transition phenomenon is influenced by the speed of
cooling of the sample. Iso-paraffin waxes show trans-
formation phenomena at the solid state in a manner
analogous to normal paraffin waxes. (See also
